Discovery of the Century: Lunar Cycles Move Trillions of Dollars on the Global Stock Markets

By Guy Cramer (Vancouver, B.C., Canada, November 13, 2026)

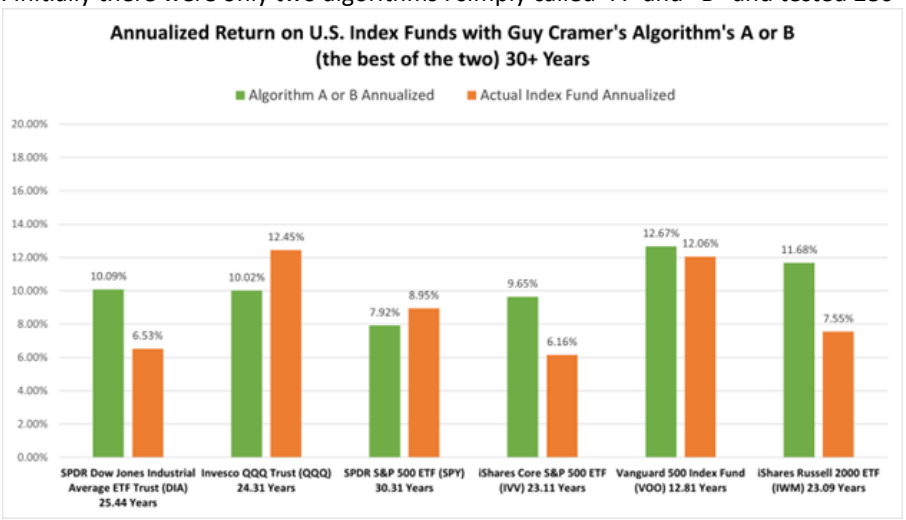

This is the real "Disclosure Day", not a Stephen Spielberg science fiction story, and like the movie this should have a global impact on how people understand something we have previously dismissed as folklore, only to find out here that it was right there in front of us all this time. Using only lunar cycles to back test 292 stocks, bonds, Indexes and ETFs, many outperformed the world's top hedge funds, and nearly all were better than the SPDR S&P 500 ETF (SPY) which is considered a benchmark by Warren Buffett and others.

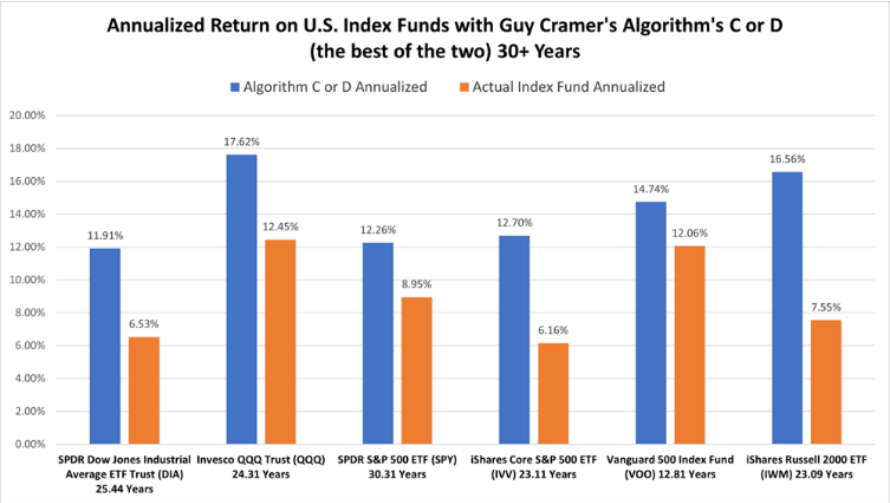

Does the lunar full moon cycle (29.53 days) influence the stock markets? I had previously developed a predictive stock market algorithm in 1999 which utilized the full moon as one of the factors but not the main functioning part of that algorithm and there seemed to be a correlation which continued for a number of years but it gradually diminished and by 2005, I abandoned it. As far as I could tell at the time, the increase of computer trading on the stock markets had overridden my human behaviour algorithm. Yet I could still see it functioning in other areas such as Presidential polling trends and athletic (sports) forecasting, something I had been doing since 1992.

In 2022 I had discussed this old algorithm with a sovereign wealth fund in the United Arab Emirates, at the time they were looking at potential acquisition of our company Hyperstealth Biotechnology Corp. and through these initial due diligence discussions, I disclosed that Hyperstealth had one million shares of our other company United Dynamics Corp. which had been based on that now defunct predictive algorithm, United Dynamics Corp. also holds one million shares of Hyperstealth Biotechnology Corp. They asked if the algorithm had been tested on cryptocurrencies which it had not as they only recently added them to the stock markets. They suggested upon my arrival back home that I check and in October I began the analysis, there was only a slight correlation, similar to what I had seen after 2005 with the non-crypto markets, not a significant amount.

In March 2023, I began to release the first of 18 papers (listed at the bottom of this article) regarding new quantitative algorithms which have demonstrated in back testing that the Efficient Market Hypothesis (EMH) is incorrect, and the markets are predictable to a much greater degree than anyone would expect. Initially there were only two algorithms I simply called "A" and "B" and tested 286 stocks in the Dow, NASDAQ and S&P 500 resulting in a total of 5,104 years tested (31 years maximum per stock) and run through a total of 1.245 billion algorithm calculations. My average annual gain on each one of the 286 stocks was 38.24% which, if it was a large hedge fund (over $150 million under management), would place it as the fourth best of the 2022 year as of the beginning of Q1 2023 when compared to the annual return for large hedge funds over the past three years. Note that is just the average gain of all 286 stocks. https://hyperstealth.com/Predictable-Stock-Markets.pdf

In September 2023 I had discovered substantial improvements leading to algorithms “C” and “D”, I had now added some stocks to increase the number to 292. To run both C and D with one stock going back a maximum of 31.5 years requires 8.2 million formulas, double over the A & B formulas. There are up to 40% fewer trades required for C and D versus A and B and the average annualized return for all 292 with algorithm C is 58.99% (22.45% better than A) and algorithm D is 58.30% (14.75% better than B). https://hyperstealth.com/FutureWealth.pdf

None of the trades are compounded, they are straight long/short trades. Brokerage fees and taxes are not considered in my back testing.

The First Breakthrough; Two Simple Lunar Algorithms

I striped the algorithm down to only the full moon cycle (29.53 days) which I have referenced in previous papers as algorithm A and the lunar proximity cycle – the time it takes the moon to travel from its closest point to Earth (perigee) to its farthest point (apogee) and back again, known as the anomalistic month (27.55 days), this I simply called algorithm B. Algorithm A trades from the New Moon to the Full Moon then shorts the trade from the Full Moon to the New Moon. Algorithm B trades from the apogee to the perigee then shorts from the perigee to the apogee.

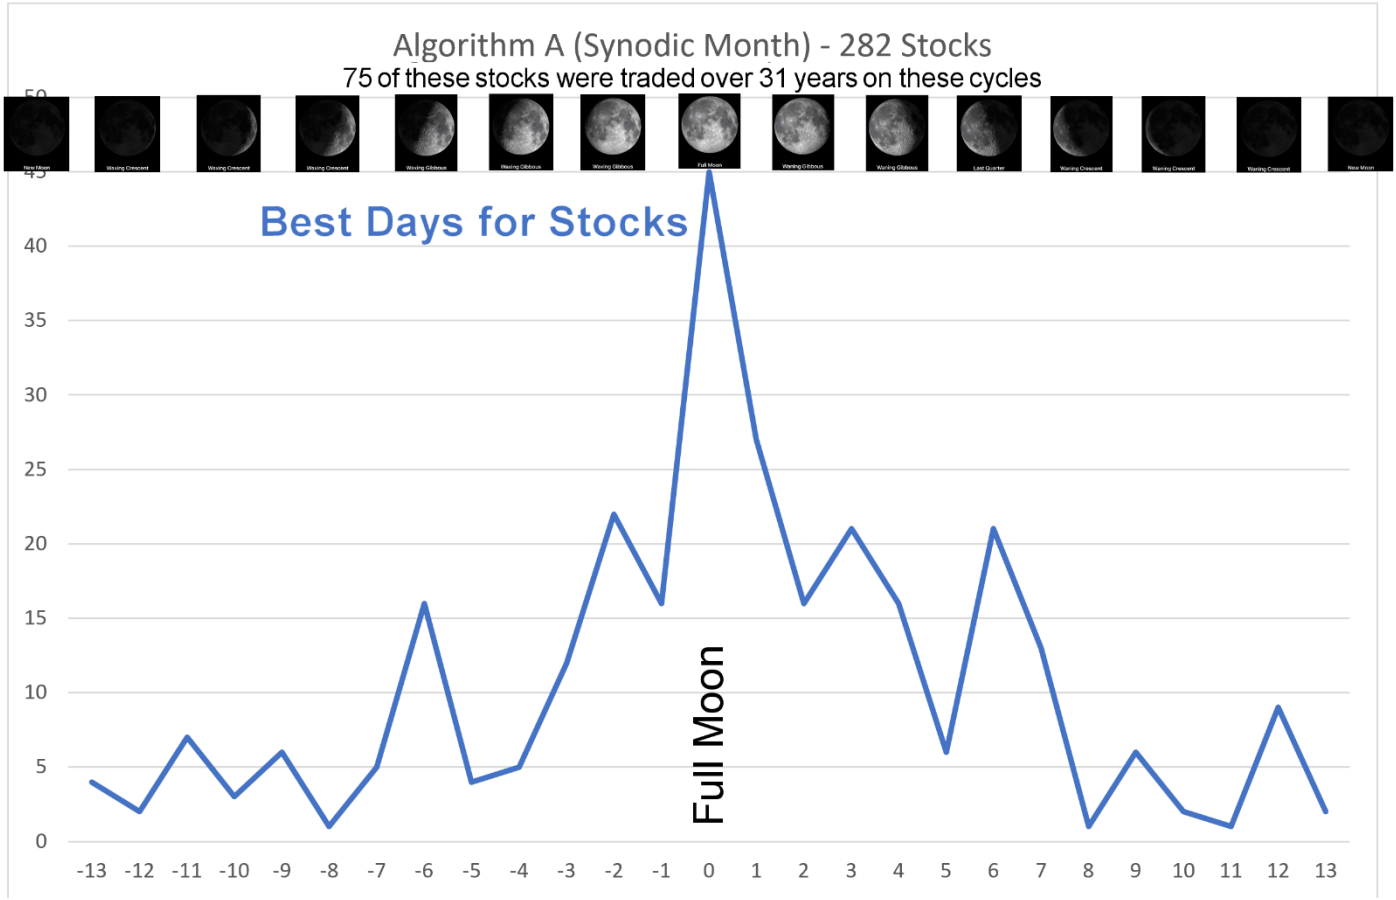

I decided to look at the affiliation with the VIX which is the volatility index – often called the fear gauge, which is based off the stock market’s expectation of 30-day forward looking volatility derived from the S&P 500 index options. If I am predicting human behaviour, then we should see an affiliation between the VIX and my algorithm, again it only showed a slight correlation.

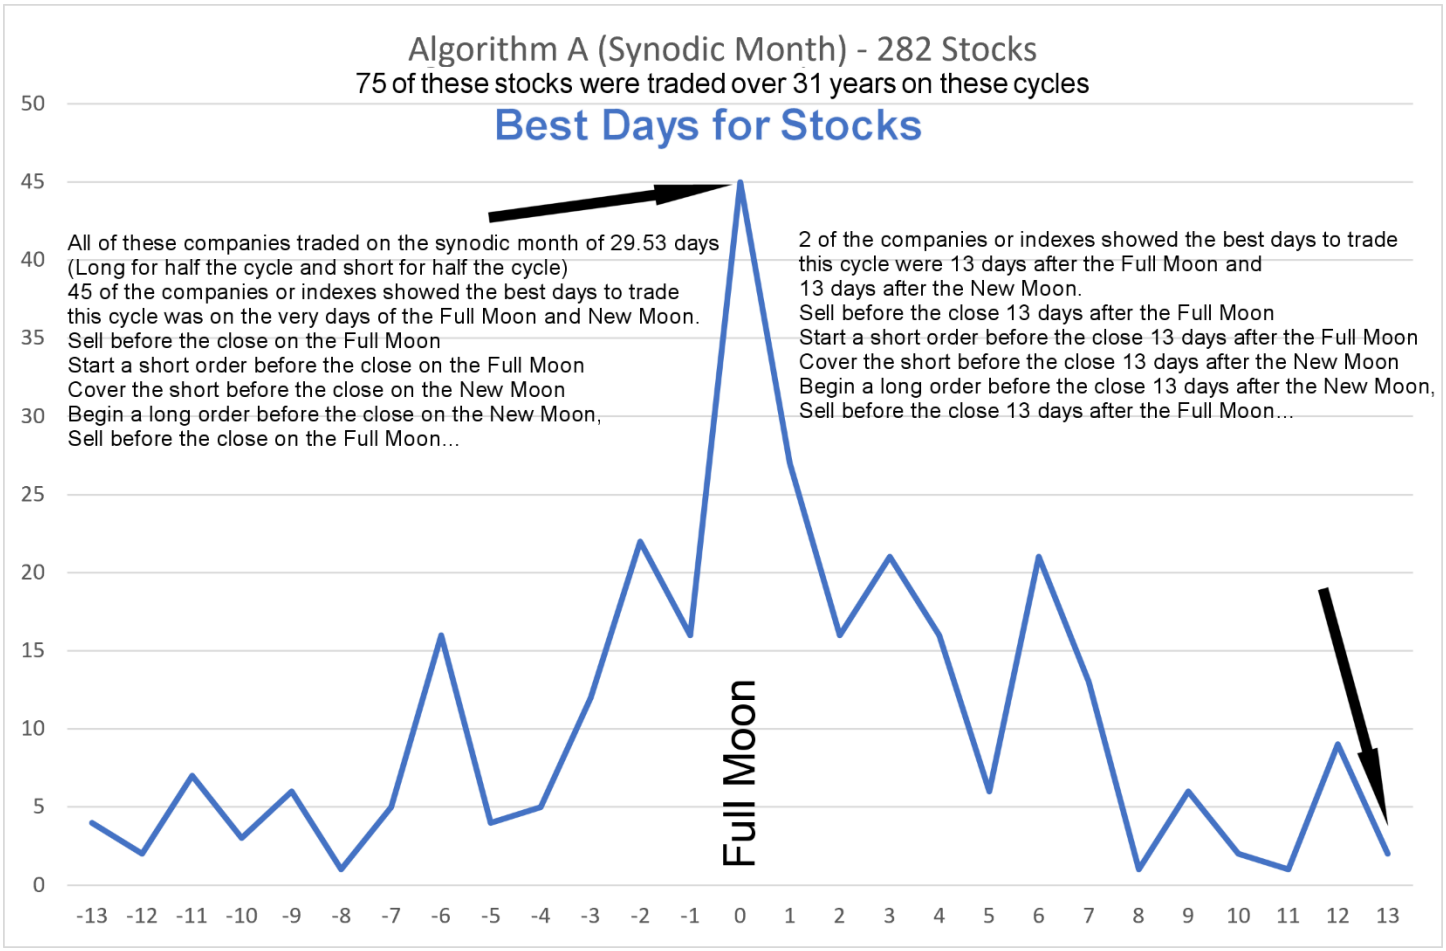

I realized that both of these lunar cycles might not necessarily coincide to the very day of the full moon or the day of the closest approach of perigee so I decided to vary the VIX on the spreadsheet tables for the calculations for my algorithms and see what would happen if I traded it a day prior to each full moon and it showed a significant improvement.

The Second Breakthrough; Try All Possibilities

Once I knew that varying the trade by a day before could improve the result I decided to run these lunar cycle trades on each one of the 13 days prior to the full moon, the day of and also the 13 days after the full moon (27 days), duplicating the equation but trading the cycle as if it started a day earlier, or two days earlier… The same concept was used on Algorithm B trading entire algorithm as if the cycle started and ended on each of the different 27 days within the anomalistic month. Note I did try 14 and 15 days out on either side but it began to change the results as the anomalistic cycle is only 27.55 days.

I now had a template I could take the historical data from numerous U.S. stocks and run all these variable trading days over 31 years of back-testing and the results were exceptional. The results began to show that some stocks traded two days prior to the full moon and two days prior to the new moon would show significantly higher returns than the actual day of. Other stocks showed a better affiliation the three days after the full moon and three days after the new moon, some showed the affiliation 6 days after. Day 0 in the chart below represents the full moon, so 45 of the stocks trading on the actual day of the full moon and the actual day of the new moon (or closest trading day if they fell on a weekend or holiday) showed their best results trading over and over on that particular day of the Synodic cycle. Conversely only 1 stock showed the best affiliation trading on the -8 days of the synodic cycle, pretending that would be the full moon, and the new moon trade would fall half the cycle later (14.76 days later). The result shows that there is a direct correlation between the full moon and the stock market cycle for most of the stocks. 75 of these stocks included go back over 31 years.

I have 64 patents to my name, 61 in the field of physics including a light bending material (invisibility), a solar panel amplifier which can triple solar panel output during winter months, a laser splitter that can split a laser into hundreds, thousands or millions of lasers which was recently tested on gallium arsenide wafers to cool them better than that of a single laser, for use in GPU's and CPU's surpassing liquid cooling with a 40-fold efficiency. There are numerous applications for our laser splitter with LiDAR (lasers that operate like Radar, for use in Physical AI where self driving vehicles and robots need to safely interact with the real world. Hyperstealth's Laser Splitter might turn Conventional Aircraft into Low Observable Stealth. The laser splitter could also be used for the detection of submerged submarines. I have also invented a display system which demonstrates a quantum superposition in the macro scale, the video image follows the viewer across numerous screens, meaning the video is present at all points across the screen at the same time, limited to the viewers location. There is evidence of quantum mechanics within each of these technologies.

I was the research assistant for 6 years 1986-1991 to my grandfather Donald L. Hings, inventor of the walkie-talkie in 1937, 56 patents to his name, a professional engineer who was self taught (had no post secondary schooling). He had developed a very sensitive ion detector which could passively track aircraft over the horizon, including the entire atmospheric re-entry and landing of the space shuttle Discovery in 1990 from thousands of kilometers away. In our daily monitoring we would notice an increase in positive ions near the full moon and had to recalibrate the instrument due to this. I had convinced my grandfather not to publish anything regarding this instrument as it could detect stealth aircraft just as easy as commercial aircraft and the release of the instrument would jeopardize the U.S. advantage in low observable aircraft.

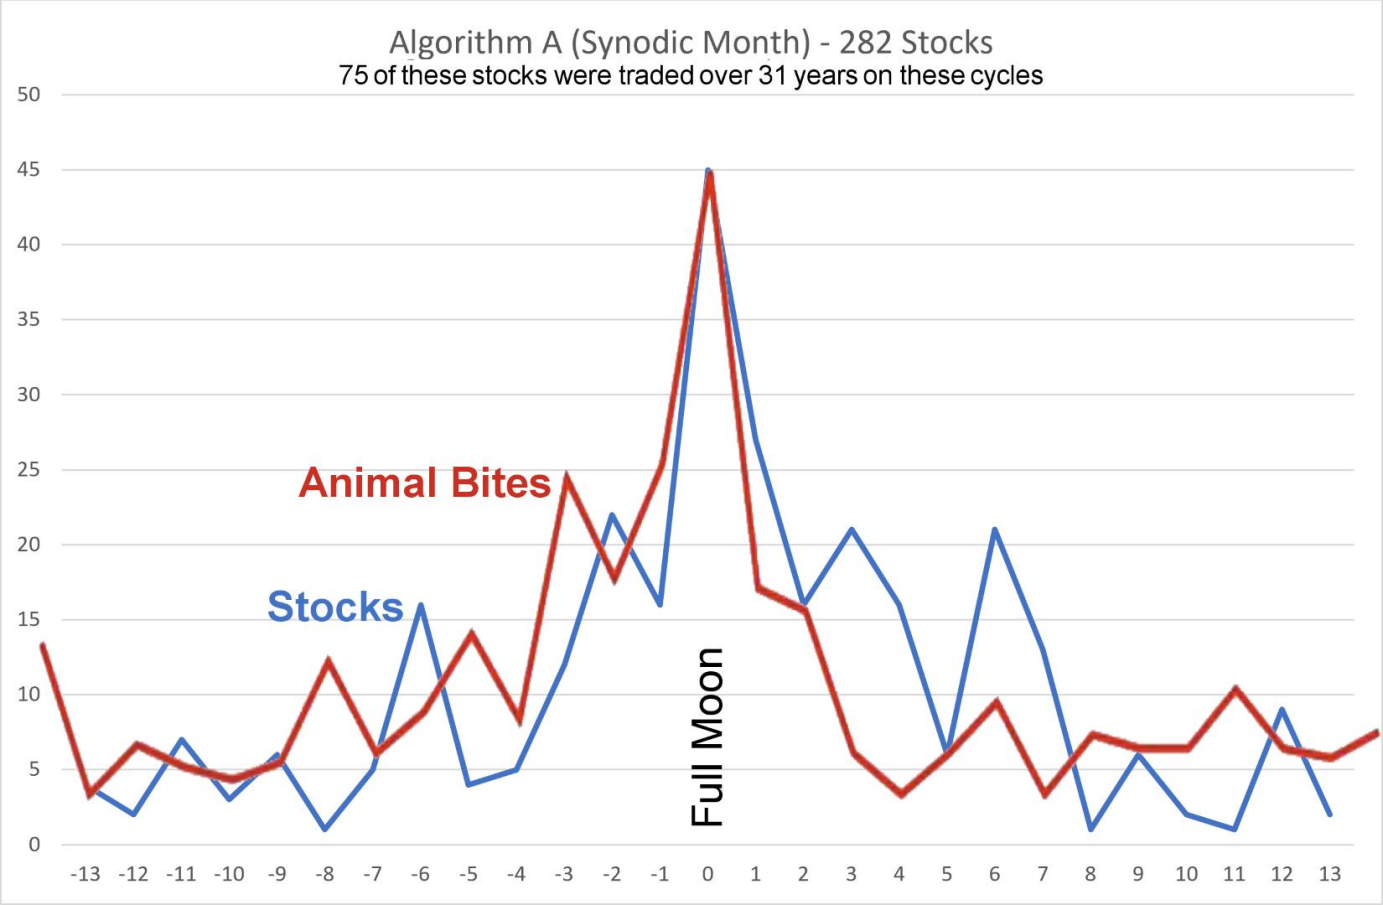

In December 2000 a study was released in England showing animal bites peaked on the full moon over the course of 37 full moons from January 1997 – December 1999 (95.1% of the bites were from dogs). Do animals bite more during a full moon? Retrospective observational analysis https://pmc.ncbi.nlm.nih.gov/articles/PMC27561/#_ad93_

This was dismissed when another group attempted the same study in Australia and found no association to the full moon and animal bites. You need to independently duplicate test results using different variable (in this case a different location) for a theory to become accepted.

My grandfather had just come back from a cruise in 1990 from the Amazon where he took a his highly sensitive portable ion detector and he declared that the air in the northern hemisphere was predominantly negative ions and the southern hemisphere was made up of mostly positive ions. Outdoors in nature there are a few thousand ions per cubic centimeter. He had me researching many fields at the time and I disagreed with his theory; this was the first time I had challenged him, stating that I believed the equatorial region was mostly positive ions, but it would flip back to predominantly negative the father south you went. He smiled and knew in a month I would be heading to Australia, Fuji and New Zealand with my father, and challenged me to predict where the flip would occur before I left on the trip and I would take the same ion detector on my trip to verify my prediction. I looked at the tropical convergence zone which moves with the time of the year, getting as high as Portland Oregon in the northern hemisphere around June 20th and we would be in New Zealand in October of 1990, my prediction was that it would flip to negative at Christchurch, New Zealand. I had my dad drive all the way from Auckland to Christchurch and the flip occurred within 100 kilometers of my prediction.

The reason I bring this up is that if the full moon is causing animals to bite on or near the full moon in England it is likely due to the increase of positive ions around that point and in Australia the results won't be the same as it is already predominantly positive so the full moon effect may not show up the way it would in England. Conventional medical research has viewed the concept of the full moon's effect on physical and psychological health as more fable than fact. I believe this will likely change.

Further Police studies from England regarding violent behaviour on or near the full moon were dismissed because they could not be replicated in Australia. In 2007, Sussex Police in England announced they would deploy more police to counter an increase in alcohol-fuelled violence they believed was linked to full moons.

A Sussex Police spokeswoman said: "Research carried out by us has shown a correlation between violent incidents and full moons" Dr Geoffrey Sheldon from Charles Sturt University examined eight years of data from the Queensland Police Service (Australia). He said the data disproved what he had initially believed: https://articles.listnr.com/crime/does-crime-spike-when-theres-a-full-moon/

The assumption that England and Australia should be treated the same way regarding lunar influence is incorrect if we are looking at the predominance of positive ions within Australia versus the higher predominance of negative ions in England. The increase of positive ions in England around the full moon will show a pronounced change versus Australia where the whole month has more positive ions than negative, the full moon will only slightly elevate this.

Side effects from positive ions winds (such as the Chinook wind in Calgary and the Santa Ana winds in southern California) compiled by a Swiss meteorological report in 1974 are as follows:

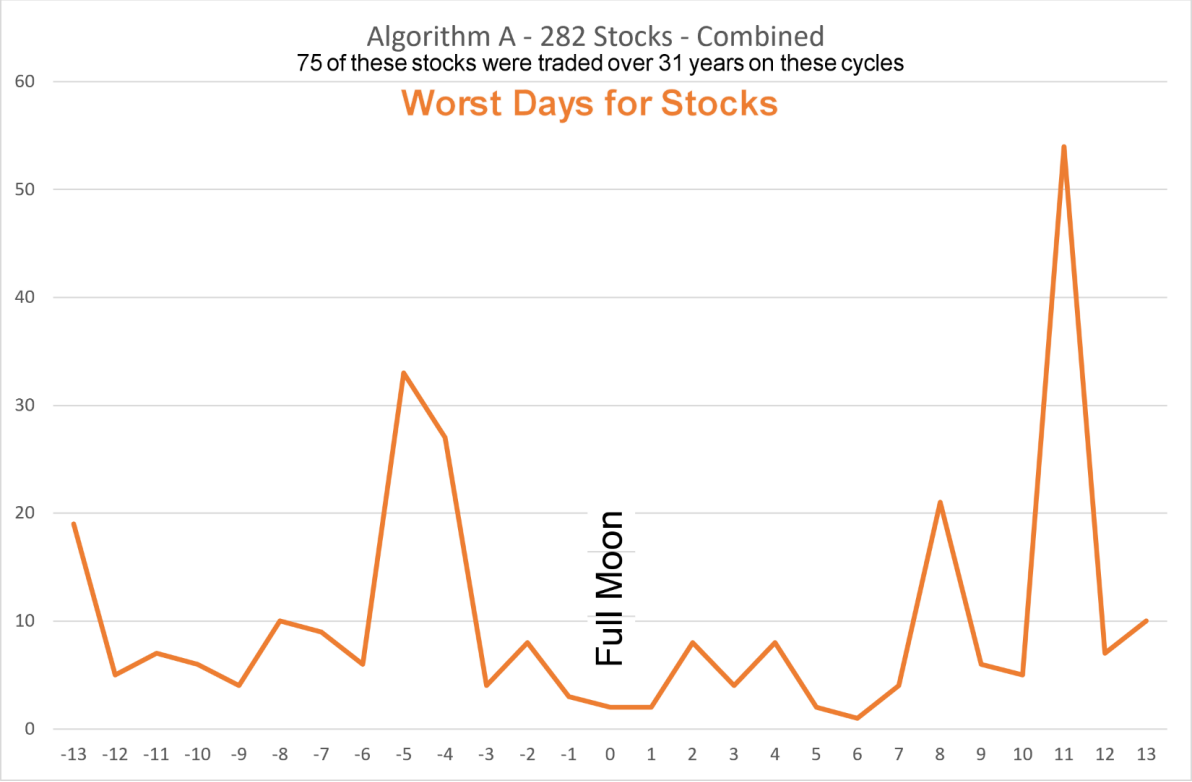

Physical side effects: Body pains, sick headaches, dizziness, twitching of the eyes, nausea, fatigue, faintness, disorders in saline (salt) budget with fluctuations in electrolytical metabolism (calcium and magnesium; critical for alcoholics), water accumulation, respiratory difficulties, allergies, asthma, heart and circulatory disorders (heart attacks approx. 50% higher) low blood pressure, slowing down in reaction time, more sensitivity to pain, inflammations, bleeding embolisms of the lungs, and thrombosis.

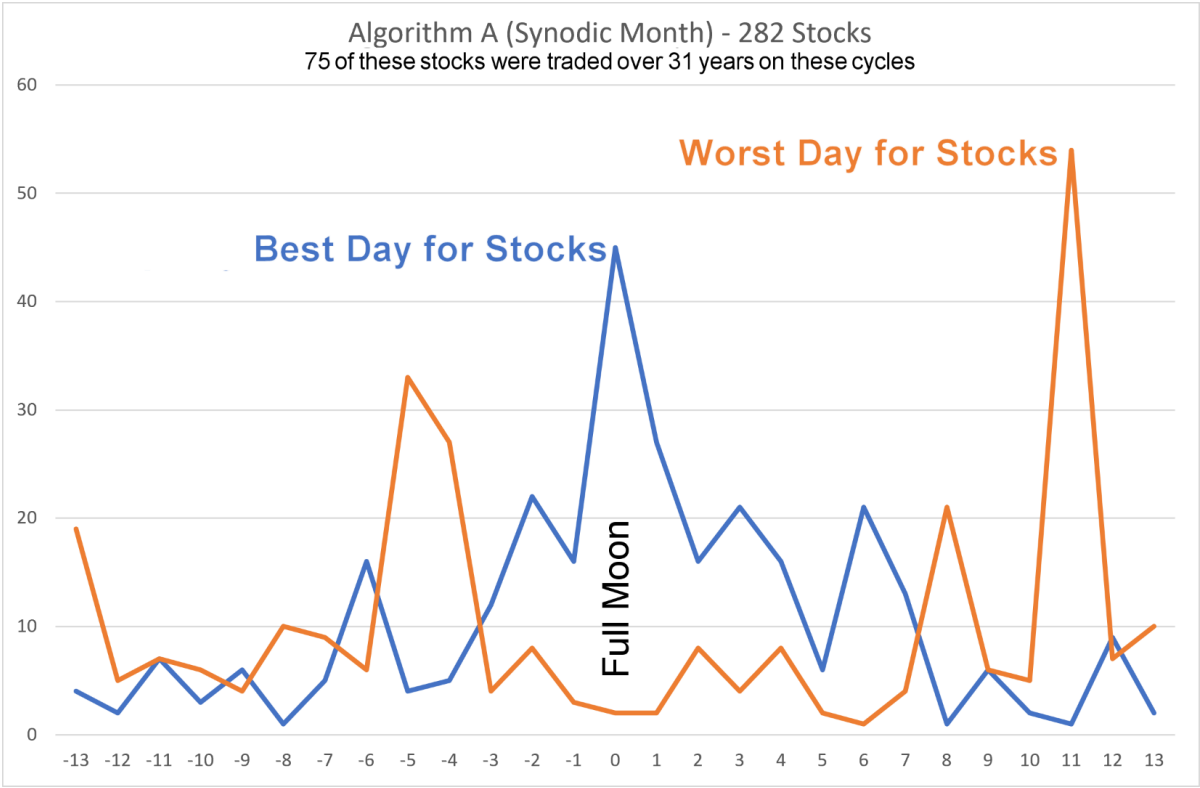

Psychological side effects: Emotional unbalance, irritation, vital disinclination, compulsion to meditate, exhaustion, apathy, disinclination or listlessness toward work (poor school achievement), insecurity, anxiety, depression (especially after age forty to fifty); rate of attempted suicide about 20% higher, larger number of admittances to clinics in drug cases.
https://ui.adsabs.harvard.edu/abs/1974IJBm...18..313S/abstract

Negative ions are the good guys here, they tend to have the only beneficial effects, which is why you can buy negative air ion generators and not positive air ion generators. Negative ions are associated with the worst days for stocks.

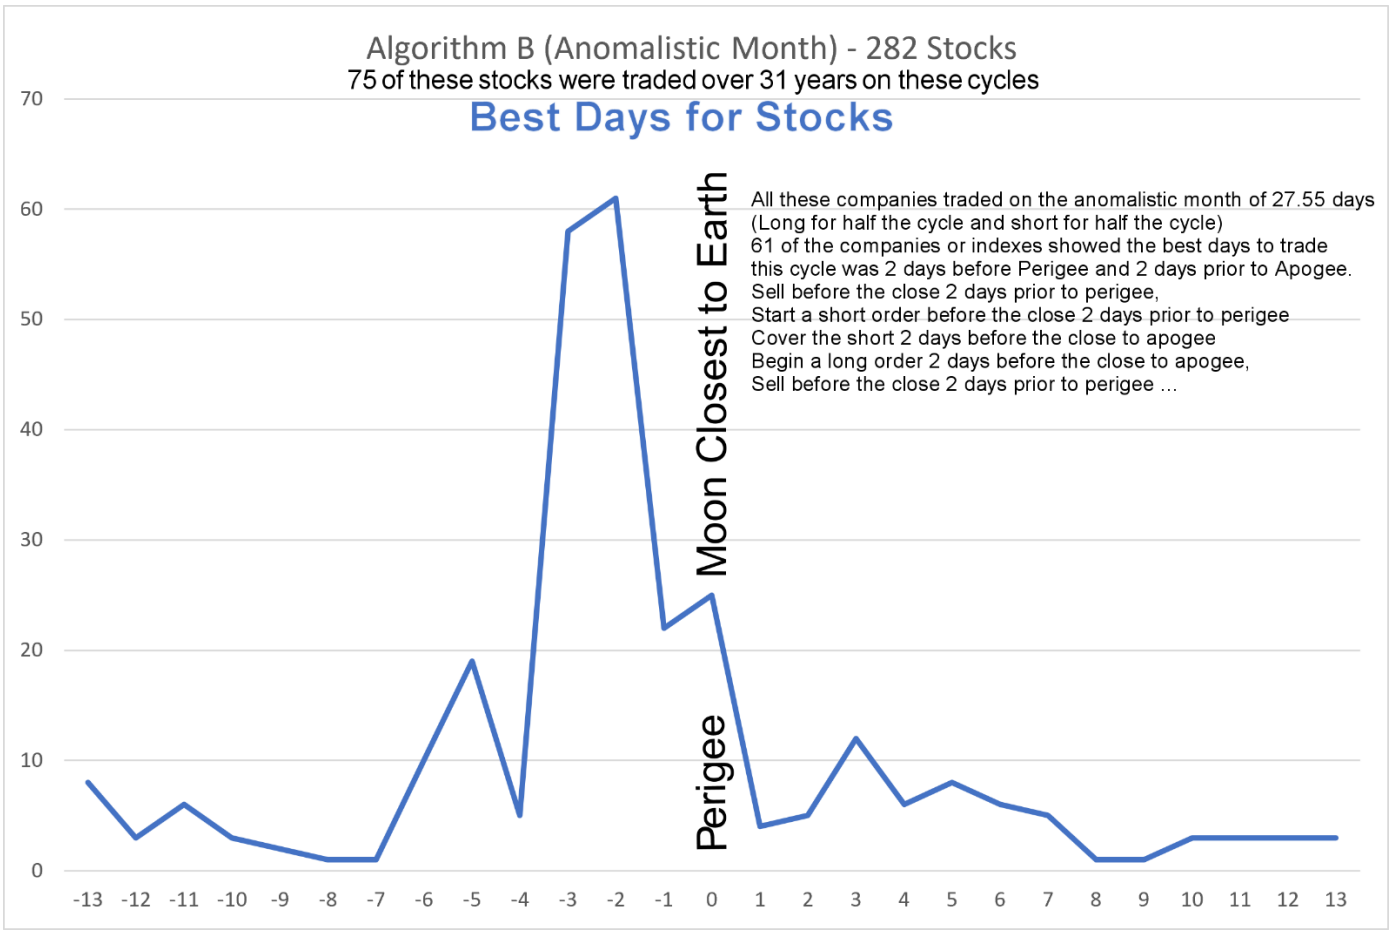

Worst days for stocks

I also had the algorithm highlight the worst trade days, because we can reverse those trades from a long to a short and a short to a long to make gains on those instead of losses. In the chart below we see two distinct peaks, the first occurs on the 5th day (33 stocks) and 4th day (27 stocks) prior to the full moon for a combined total of 60 over those two days and 11 days after the full moon with another 54 stocks. 114 of the stocks fall on these three days.

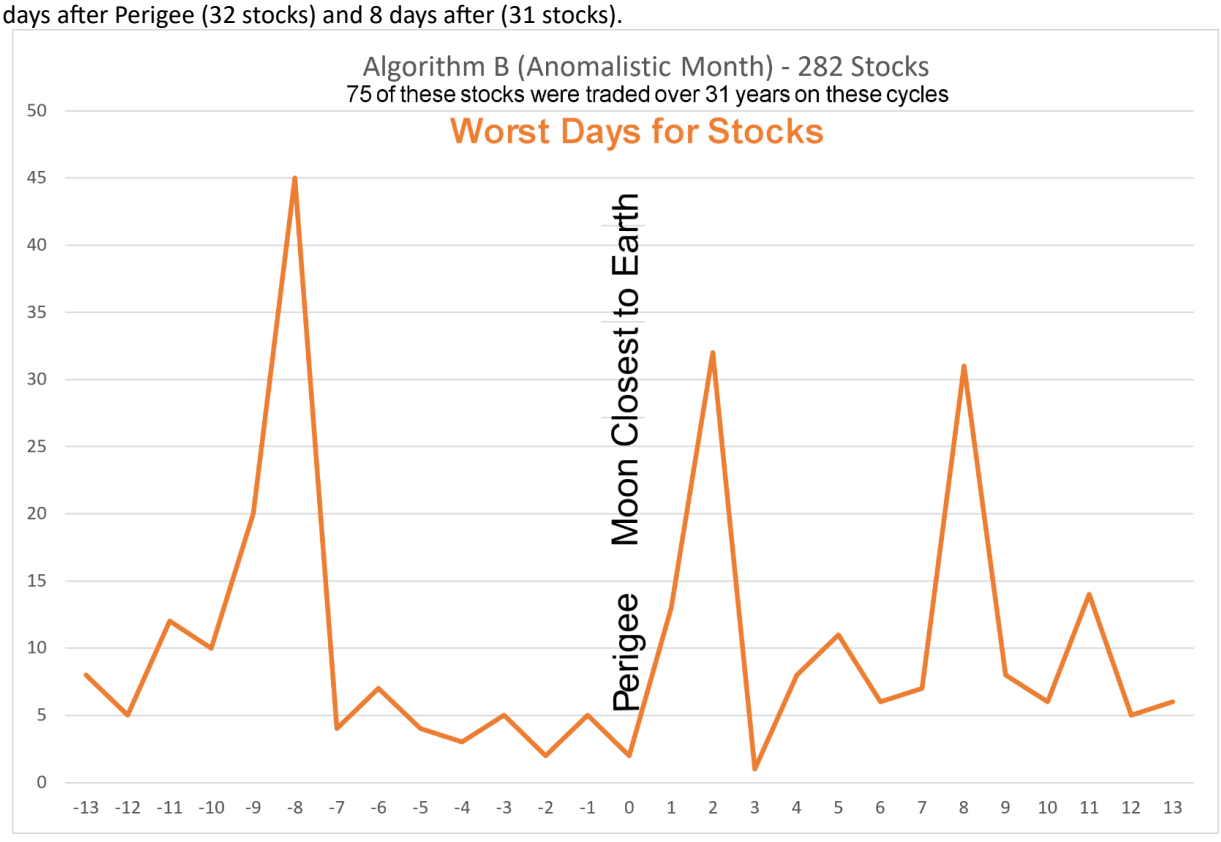

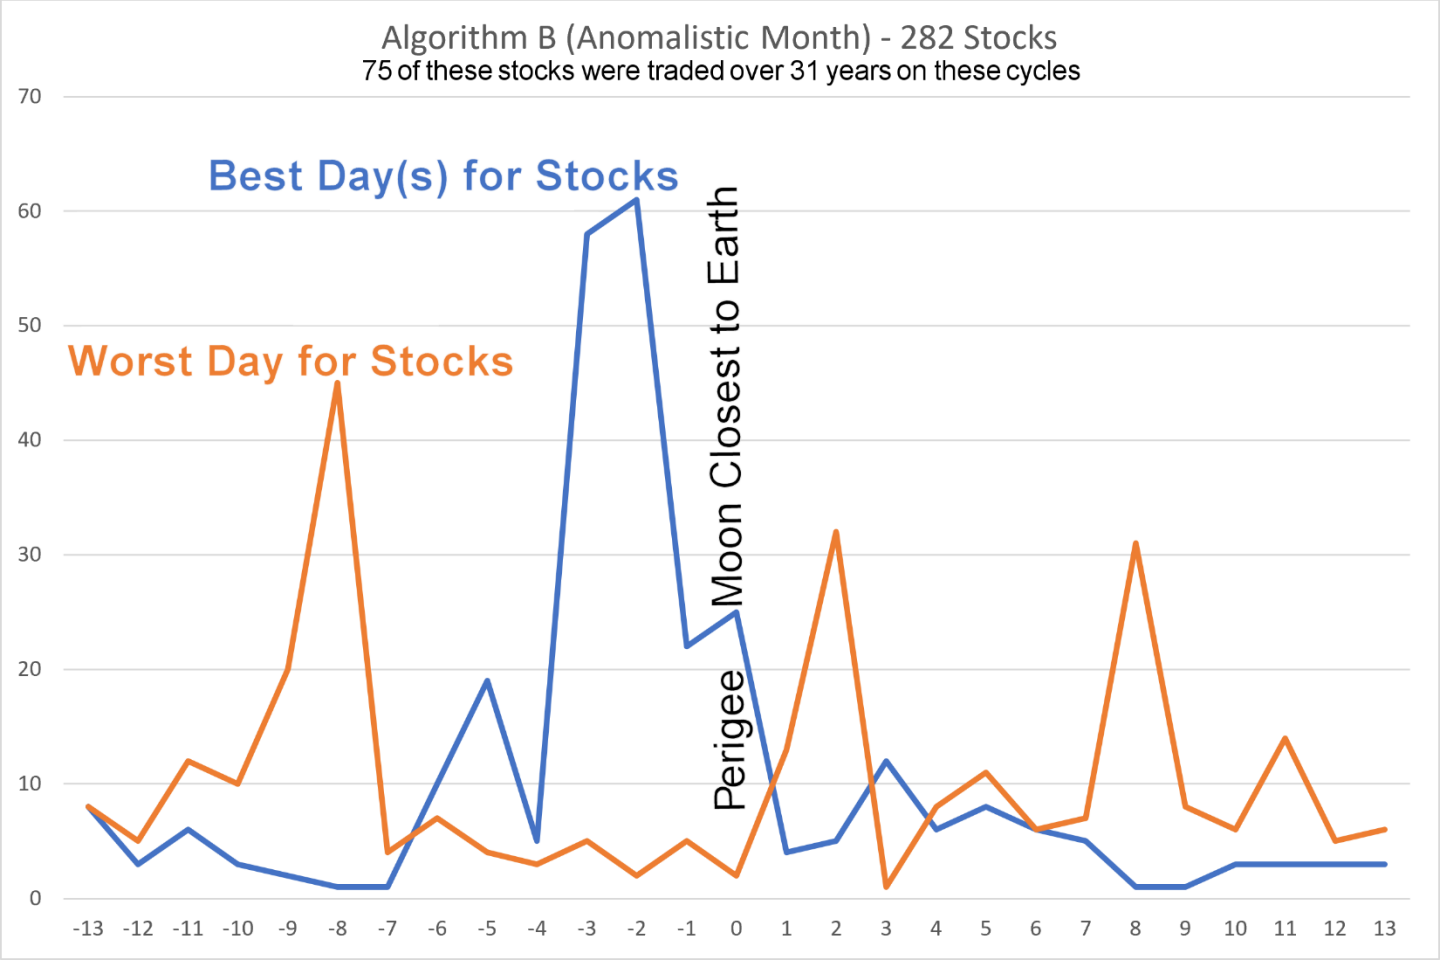

Even better results occurred with Algorithm B using this method. 58 stocks traded best 3 days before perigee with the end of that trade 3 days before apogee and 61 stock traded better 2 days before perigee and 2 days before apogee (119 stocks of the 282 over these 2 days). Conversely only 4 stocks traded best the day after perigee and the day after apogee.

I also applied the same equation for worst days for algorithm B and here we see three distinct peaks, 8 days prior to Perigee (45 stocks), 2 days after Perigee (32 stocks) and 8 days after (31 stocks).

What about Algorithm's C and D?

Algorithm C is an improved version of A and algorithm D is an improved version of B. In the charts above we treat each cycle independent of the other but if they both influence the ion ratios and they are slightly different cycles then when the full moon coincides with the perigee then there should be a stacking effect and when the full moon coincides with apogee then there should be a nullifying effect.

For each stock using the Full Moon cycle (algorithm A) over 31 years, there were approximately 788 trades (long trades and short trades). For each stock using the anomalistic cycle (perigee to apogee and back again) (algorithm B) there were 845 trades (long trades and short trades). With algorithm C and D, I tried two different trades I called green and red with different gaps where the nullification would occur. Green algorithm C = 326 trades and green algorithm D = 342 trades and for Red I had less of a gap where the nullification occurs within the overlapping cycles resulting in Red algorithm C = 400 trades and red algorithm D= 488 trades. Far fewer trades with improved results over Algorithm's A&B.

Warning about trying to use this method!

Now that this is publicly disclosed, I expect it will be factored into the markets, to stop people from capitalizing on it. You also need to know which stocks worked best on which days, and past performance is not indicative of future performance. Shorting stocks is also dangerous as you have the ability to make money if the stock falls but unlike a long order where you might only lose 100%, you can lose much more than 100% in a short order if it goes up too fast. Short a stock at $5.00 per share and it goes to $15.00, you lost 200%. I am also not a money manager or a financial expert and the background company information of each stock tested means nothing to me, I tested each stock, index, bond and ETFs the same as the others.

Who owns this?

Note: These A,B,C,D algorithms are the property of Guy Cramer and not the property of Hyperstealth Biotechnology Corp. as I did not want the board of directors or shareholder to control my decisions regarding them, such as releasing them publicly today.

United Dynamics Corp. has a medium frequency (between a day and a few days) quantitative trading strategy algorithm used in the early 2000's. This previous United Dynamics algorithm was reviewed by an accounting firm which verified my phantom portfolio forecasted trading times were made before all the trades and in the year 2000 that system would have gained 164.50% in just one year of trading the Nasdaq Index stock QQQ, the actual QQQ lost -28.56% over the same period.

You could have been the richest person in the world! Why disclose this rather than capitalize on it?
I have alluded to this from my very first paper (Part 1 below). I have no desire to be a trillionaire, this discovery while showing a correlation to market movements effects much more than this, if people who suffer from stress, depression, anxiety… knew there is a huge external influence on their mindset, they may be better able to cope with those few bad days. Seeing road rage increase during the full moon may allow us to deescalate our own response to aggressive drivers…

I am not taking a pledge of poverty; I do want a roof over my head and for my family and a reliable vehicle to drive but I have no desire to become an elitist.

Why disclose this now?
Circumstances; my last paycheck from Hyperstealth covered February 2022, and my wife and I have used our line of credit to survive until this point, but it has finally reached the end this month. Hyperstealth has about $400,000.00 owing to our patent lawyer and corporate attorney for all the recent patents and pending patents, yet we have had little to no investment into the company since 2022 which does not make any sense to me, to our corporate attorney, to our patent attorney and some close friends who know what we have as within the time we have had 61 patents granted.

I had proposed over the past two years that the Canadian government acquire the algorithms and utilize them for a sovereign wealth fund, but I never received any interest. The UAE sovereign wealth fund never reconnected with me after my trip in 2022, I tried numerous times. My many papers showing my results of the algorithm but not the reason behind them seemed to fall on deaf ears, no one was interested.

We have had several interested parties in Hyperstealth come and go before any financing was completed. We had a written agreement for the U.S. exclusive license in January this year (2026) which would have put us back in the black and would have provided me the extra income to use with the algorithms with real money to prove to people it worked without disclosing what the algorithm's were but that company breached the agreement when they could not come up with the initial financing.

We had a company looking to acquire us which the team of executives were flying in a private plane from the east coast of the U.S. to Vancouver, Canada and they developed a crack in the windshield on the flight so they diverted to San Diego as they would be grounded in Vancouver for a few weeks but could get it repaired within a day or two in San Diego and the meeting never took place. None of this makes much sense unless there are greater powers at play.

I am a man of faith, and I believe God has a plan for all of us. I have the privilege of having a grandfather who was an expert in air ions who developed a very sensitive detector which allowed us to see things others could not. We had no idea at the time that these cycles had any impact on people. I have an analytical thought process due to the unconventional training by my grandfather and perceive things differently than I might have if I was trained through college or university.

What if God decided that He wanted to have this revealed to everyone but needed to entrust it to someone who did not have the desire to have great wealth and did not have the means to capitalize on it personally for 4 years until there was no possible future to utilize personally. I have felt the push to go this route but resisted, thinking; if only we get that license or large investor or acquired…, I could use the algorithms for huge personal gain, but it was not meant to be as I believe God always had other plans for it; I am grateful to be chosen for this work and pray that it will bring peace and hope to many.

Why me?
Throughout the Bible, God consistently demonstrates His sovereign power and wisdom by choosing the lowly, the humble, and the seemingly insignificant to fulfill His divine purposes. This theme underscores the biblical truth that God's ways are not man's ways, and His criteria for selection often defy human expectations.

God's use of the lowly serves as a profound reminder of His grace and the upside-down nature of His kingdom. In 1 Corinthians 1:27-29, Paul writes, "But God chose the foolish things of the world to shame the wise; God chose the weak things of the world to shame the strong. He chose the lowly and despised things of the world, and the things that are not, to nullify the things that are, so that no one may boast in His presence." This passage encapsulates the divine strategy of using the humble to accomplish His purposes, ensuring that all glory is directed to God alone. https://biblehub.com/topical/g/god's_use_of_the_lowly.htm

I expect many to mock my choice to release this publicly and not keep quiet about the algorithms and attempt to capitalize personally but I have come to accept this roll as more of a caretaker of the algorithms than as a beneficiary of them, I am considering providing these lunar cycle forecasts as they have trended in the past with the markets to help people see the relationship between how we feel and how we think differently during the high and low points of these cycles and the unseen influence that the moon appears to have over us.

I have no idea how this disclosure will change the markets, but it should. If I could outperform Berkshire Hathaway and the top hedge funds of the world with these simple algorithms using a series of spreadsheets, imagine what AI will be able to discover once it is pressed into this.

There is more to come but this is a lot for people to digest at this time, and I did not want to make this too confusing today. I want to let this sink in before more is released.

The irony is that I also need to decide what I will be doing for work in the coming weeks to pay the bills.

My hope is that this disclosure, although not part of Hyperstealth, will put those technologies into the spotlight they deserve and that people recognize the glory of God through this.

For what does it profit a man to gain the whole world and forfeit his soul? Mark 8:36 ESV

“Do not lay up for yourselves treasures on earth, where moth and rust destroy and where thieves break in and steal, but lay up for yourselves treasures in heaven, where neither moth nor rust destroys and where thieves do not break in and steal. For where your treasure is, there your heart will be also. Matthew 6:19-21 ESV

“No one can serve two masters, for either he will hate the one and love the other, or he will be devoted to the one and despise the other. You cannot serve God and money. Matthew 6:24 ESV

And he said to them, “Take care, and be on your guard against all covetousness, for one's life does not consist in the abundance of his possessions.” Luke 12:15 ESV

But those who desire to be rich fall into temptation, into a snare, into many senseless and harmful desires that plunge people into ruin and destruction. 1 Timothy 6:9 ESV

Keep your life free from love of money, and be content with what you have, for he has said, “I will never leave you nor forsake you.” Hebrews 13:5 ESV

The Pharisees, who were lovers of money, heard all these things, and they ridiculed him. Luke 16:14 ESV

These algorithms would be my second biggest discovery, my top discovery happened 30 years ago and it involved three documented time reversals, two of which occurred in the past 78 years, challenged Professor Stephen Hawking's concepts of time travel.
